DSM RTR (ROUTER)

As sites get larger, more infrastructure is required in order to operate a site efficiently. The DSM-RTR is specifically designed to provide the infrastructure to scale networks reliably. The DSM-RTR is used in native BACnet networks to connect sites together, connect networks to the Internet and to form WAN networks. In addition to this the DSM-RTR can be used to manage network traffic so that unwanted traffic can be restricted or blocked, thus increasing the overall network performance. Site integration with 3rd party products can be difficult and frustrating and the DSM-RTR can help allowing you to have a functional site running at top performance.
